

PARENT FACULTY INTERACTION

ABSTRACT

Parent Faculty Interaction is a web-based application makes it easy for parents and faculty to communicate effectively. It offers features like Daily attendance, progress updates, event alerts, and secure user authentication. The goal is to strengthen the connection between parents and teachers, creating a supportive environment for the student's education. The system features a user-friendly interface. A secure portal facilitates confidential one-on-one communication between parents and faculty, encouraging discussions about individual student needs.

INTRODUCTION

Objective

The primary objectives of the Parent-Faculty Interaction are designed to establish and nurture a strong partnership between parents and faculty, fostering an environment conducive to the holistic development of students. The project aims to enhance communication channels, ensuring timely and transparent exchanges of information between parents and teachers. By promoting active parental involvement in college activities, parent-teacher conferences, and volunteer opportunities, the project seeks to create a sense of shared responsibility for each student's educational journey. Parent-Faculty Interaction project aspires to create a supportive educational ecosystem where the collective efforts of parents and faculty contribute to the overall success and well-being of every student.

SYSTEM ANALYSIS

Existing System

The current system for parents and faculty interaction involves traditional methods like occasional parent-teacher meetings or written communication. Parents usually get updates on their child's progress through report cards or occasional notes. However, this system may not be as immediate or convenient. There's often a lack of real-time communication, making it harder for parents to stay actively involved in their child's education. An improved system is needed to make communication more accessible, timely, and interactive for better collaboration between parents and teachers.

Disadvantages of existing system

Communication Gaps: Inefficient communication channels may lead to gaps in information exchange.

Lack of Transparency: An existing system may lack transparency in terms of grading criteria, assessment methods, and overall academic expectations.

Inadequate Technology Integration: If the system does not leverage modern technology, such as online platforms, mobile apps, or web portals, it may result in inefficiencies.

Proposed System

The proposed system involves a user-friendly online platform accessible through computers and phones. Parents receive instant notifications about college announcements, events, and their child's achievements. There's a secure space for private discussions between parents and teachers, making it easy to address individual concerns. parent-teacher conferences, and real-time messaging web apps serve as crucial channels for personalized discussions about student progress, strengths, and areas for improvement.

Advantages of the Proposed System

Increased Accessibility: The new system may offer more accessible channels for communication, including digital platforms, mobile apps, or online portals.

Real-time Updates: A modern system might provide real-time updates on a student's performance, attendance, and other relevant information.

Requirement Gathering

Functional Requirement

It supports incorporate a robust user authentication system, enabling parents and teachers to securely create accounts and log in. The platform should enable teachers to input and update student grades, while parents gain access to their child's academic progress. It must prioritize security and privacy, implementing secure data transmission and storage practices.

Non-Functional Requirement

Scalability: The system should be able to handle an increasing number of users without a drop in performance.

Reliability: The platform should consistently work without unexpected downtime or glitches.

Usability: The interface should be easy to navigate and understand for both parents and faculty members.

Security: Measures should be in place to protect user data and ensure secure communication.

Compatibility: The system should work well across various devices and web browsers.

Response Time: The platform should provide quick responses to user actions, ensuring a smooth experience.

Accessibility: The system should be designed to be usable by individuals with different abilities and needs.

Compliance: The platform should adhere to relevant regulations and standards for data protection and user privacy.

SYSTEM SPECIFICATION

Hardware Specification

Processor : Intel(R) Core (TM) i3
RAM : 4 GB
System type : 64-bit operating system, x64-based processor

Software Specification

Operating System : Windows 10
Front End : PHP
Web Server : XAMPP()
Development tool : Visual Studio Code()
Back End : MySQL
Designing : HTML, CSS
Validation : JavaScript

SOFTWARE DESCRIPTION

Programming Language

HTML

Hypertext Markup Language (HTML) is the standard mark-up language for creating web pages and web applications. Web browsers receive HTML documents from a webserver or from local storage and render them into multimedia web pages. HTML describes the structure of a web page semantically and originally included cues for the appearance of the document. Web browsers receive HTML documents from a webserver or from local storage and render them into multimedia web pages. HTML describes the structure of a web page semantically and originally included cues for the appearance of the document.

CSS

Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation of a document written in a mark-up language. Although most often used to set the visual style of web pages and user interfaces written in HTML and XHTML, the language can be applied to any XML document, including plain XML, SVG and XUL, and is applicable to rendering in speech, or on other media. Along with HTML and JavaScript, CSS is a cornerstone technology used by most websites to create visually engaging web pages, user interfaces for web applications, and user interfaces for many mobile applications. CSS is designed primarily to enable the separation of presentation and content, including aspects such as the layout, colors, and fonts. This separation can improve content accessibility, provide more flexibility and control in the specification of presentation characteristics, enable multiple HTML pages to share formatting by specifying the relevant CSS in a separate .CSS file, and reduce complexity and repetition in the structural content.

DEVELOPMENT TOOLS AND TECHNOLOGIES

FRONT END-PHP

PHP is a language that has outgrown its name. It was originally conceived as a set of macros to help coders maintain personal home pages, and its name grew from its purpose. Since then, PHP's capabilities have been extended, taking it beyond a set of utilities to a full-featured programming language, capable of managing huge database-driven online environments.

As PHP's capabilities have grown, so too has its popularity. According to Net Craft (<http://www.netcraft.com>), PHP was running on more than 1 million hosts in November 1999. As of February 2000, that figure had already risen to 1.4 million hosts. According to E-Soft, PHP is the most popular Apache module available, beating even ModPerl.

PHP is now officially known as PHP: Hyper Text Preprocessor. It is a server-side scripting language usually written in an HTML context. Unlike an ordinary HTML page, a PHP script is not sent directly to a client by the server; instead, it is parsed by the PHP binary or module. HTML elements in the script are left alone, but PHP code is interpreted and executed. PHP code in a script can query databases, create images, read and write files, talks to remote servers - the possibilities are endless.

The output from PHP code is combined with the HTML in the script and the result sent to the user. The first version of PHP was created by Rasmus Lerdorf in 1994 as a set of Web publishing macros. These were released as the Personal Home Page Tools and later rewritten and extended to include a package called the Form Interpreter (PHP/FI). From a user's perspective, PHP/FI was already an attractive proposition, and its popularity grew steadily.

It also began to attract interest from the developer community. By 1997, a team of programmers was working on the project. The next release— PHP3— was born out of this collaborative effort. PHP3 was an effective rewrite of PHP, with an entirely new parser created by Zeev Suraski and Andi Gutmans, as well as differences in syntax and new features. This release established PHP as one of the most exciting server scripting languages available, and the growth in usage was enormous.

PHP's support for Apache and MySQL further secured its popularity. Apache is now the most-used Web server in the world, and PHP3 can be compiled as an Apache module. MySQL is a powerful free SQL database, and PHP provides a comprehensive set of functions for working with it.

BACK END-MySQL

Databases are a great way to store information they can store your personal contact list, your financial records, your household inventory, or even a listing of your favorite websites. Databases are able to store large amounts of useful information in a logical structure that allows for quick retrieval in any user defined format. Community libraries are renowned for their use of large database systems to store the mass amounts of usable information that they collect and share.

Databases also play a major role in today's web applications by storing complete inventories of products and services and making these accessible through a programmed web front-end. A database has the ability to provide dynamic content to a web shop by providing the content to web pages. Many Linux distributions implement PHP, MySQL, and Apache as a perfect combination for full featured dynamic.

Apache Web Server

Apache is the most widely used HTTP-server in the world today. It surpasses all free and commercial competitors on the market and provides a myriad of features; more than the nearest competitor could give you on a UNIX variant. It is also the most used web server for a Linux system. A web server like Apache, in its simplest function, is software that displays and serves HTML pages hosted on a server to a client browser that understands the HTML code. Mixed with third party modules and programs, it can become powerful software, which will provide strong and useful services to a client browser.

PROJECT DESCRIPTION

Problem Definition

In simple terms, the problem definition in parent-faculty interaction refers to clearly understanding and describing the issues or challenges that arise when parents and teachers communicate or work together. It involves identifying specific areas of concern, such as lack of communication, misunderstandings, or any obstacles that may hinder a positive and effective partnership between parents and faculty members in supporting a child's education and well-being.

Overview of the Project

The Parent-Faculty Interaction web application project aims to create an online platform that facilitates smooth communication and collaboration between parents and teachers. Parents can easily stay informed about their child's progress, upcoming events, and important announcements from the college. Faculty can share updates, grades, and individualized feedback with parents. The project focuses on user-friendly interfaces, real-time notifications, and secure data handling to ensure an effective and positive interaction between parents and faculty members. Regular feedback and testing will guide the continuous improvement of the application to meet the specific needs of both parents and faculty.

MODULE DESCRIPTION

Administrator (Faculty): Administrator are the one who can create, edit and delete any information about the student. Administrator has full privilege of the website.

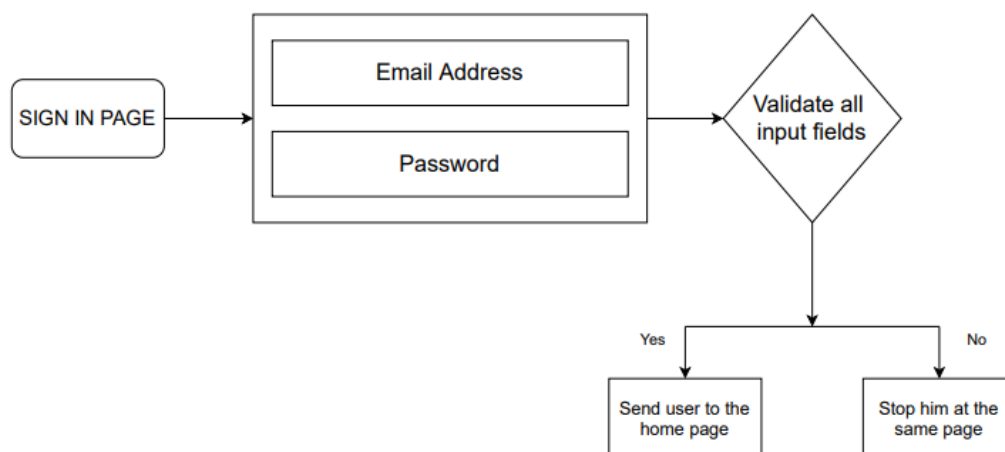

Parents: Parents can view their students' grades, Daily Attendance, Announcement and they can also interact with faculty.

Announcement: This module has occurring of programmed events, PT meeting schedule, Test marks, Daily Attendance, Important Notice, Certificates.

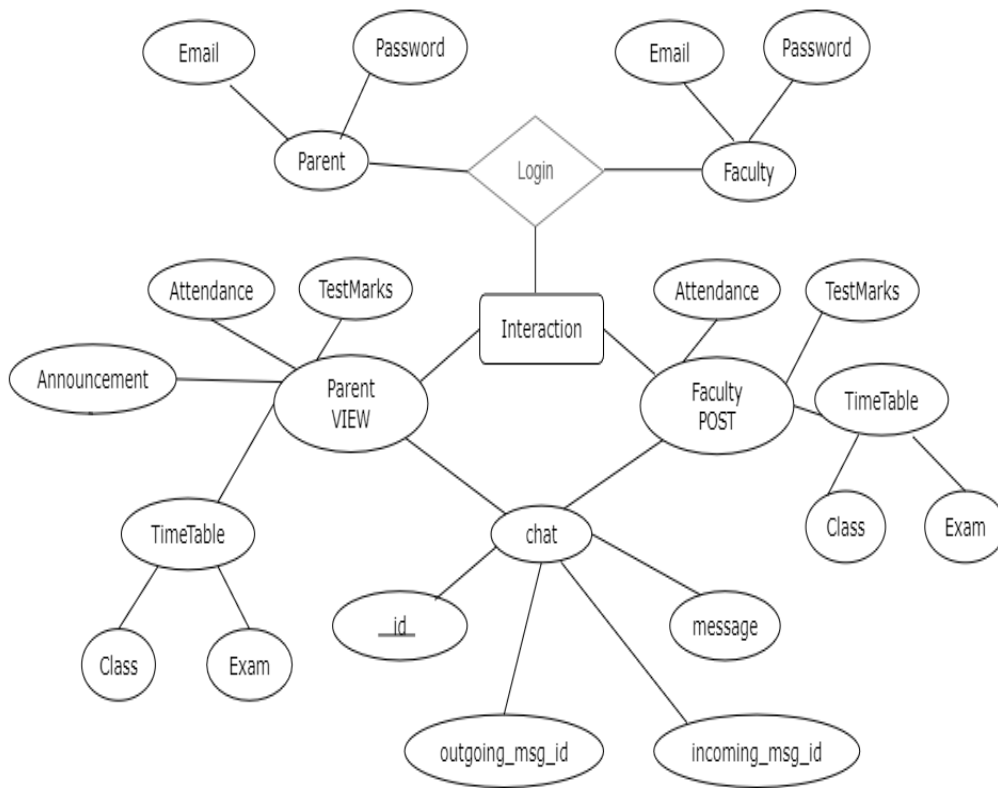

Communication: This module helps to interact with Parents like messaging.

DATABASE DESIGN

The data pertaining to proposed system is voluminous that a careful design of the database must Precede design of the database must proceed before storing the data in the database. A database management system provides flexibility in the storage and retrieval of data held production of information. The DBMS is a bridge between the application programs. This determines what data are needed and how they are processed and the operating system of the computer, which is responsible for placing data on the magnetic storage devices. A schema defines the database and a sub scheme defines the portion of the database that a specific program will use

CONCLUSION & FUTURE ENHANCEMENTS

Conclusion

Thus, the project entitled “Parent Faculty Interaction” was successfully completed and implemented. When parents and teachers communicate well, it's like having a support squad for the college journey. Parents get to know how things are going, and teachers can share insights about classes and progress. This teamwork helps students tackle challenges and make the most out of their college experience. It’s not just about grades – it's about creating a network that cares about success.

Future Enhancement

The Future enhancements there's a promising scope for advancing parent-faculty interaction through the use of modern technology. Platforms like video calls, zoom meetings, and other virtual communication tools can play a pivotal role in bridging the gap between parents and faculty. These technologies allow for real-time discussions about a child's progress, enabling parents to actively participate in their education from the convenience of their homes. Future development could focus on user-friendly interfaces and accessible technology, ensuring that even those less familiar with digital tools can easily engage.
